Recursion is a problem solving strategy
where problems are solved via solving **subproblems**
(smaller or simpler instances of the same problem)

In programming, we solve problems recursively by
using functions that call themselves

FunctionsRecursion vs.
Iteration

- A recursive function calls itself
- This is possible because there is a difference between a *function* and a *function call*
- Each function call creates a new mini-environment, called a *stack frame*, that holds all the local variables used by the function call

Consider this program (no recursion):

```
int main(void) {  
    a(5);  
}  
  
void a(int val) {  
    b(val);  
}  
  
void b(int val) {  
    printf("%d\n", val);  
}
```

This is how the state of the stack changes:

Example: summing values of a list

- Base case: empty list
 - Sum of an empty list is zero
- Non-empty lists
 - I can't solve the whole problem directly
 - But I do know the first value in the list
 - And if I can sum the rest of the list (smaller than whole list)
 - Then I can add the first value to the sum of the rest of the list, giving the sum of the whole list

First, **think**:

- How can the solution be expressed in terms of subproblems?
- What would the subproblem(s) be?
- How can you relate the original problem to the subproblem(s)?
- What are the base cases?

Then, **implement**:

- Implement base case(s) first
- Then implement recursive cases
- Each subproblem corresponds to a recursive call
 - **Assume** that the function works for the subproblem(s)
 - Like in Mathematical Induction!

Helper
FunctionsRecursion vs.
Iteration

```
1 struct node *listAppend(struct node *list, int value) {  
2     if (list == NULL) {  
3         return newNode(value);  
4     } else {  
5         listAppend(list->next, value);  
6         return list;  
7     }  
8 }
```

Consider this list...

...and this function call:

```
listAppend(myList, 5);
```

Definition

Example -
PyramidExample -
FactorialHow
Recursion
WorksRecursion on
Linked ListsExample - List
SumHow to Use
Recursion

Exercises

Example - List
AppendMore
ExercisesRecursive
Helper
FunctionsRecursion vs.
Iteration

```
1 struct node *listAppend(struct node *list, int value) {  
2     if (list == NULL) {  
3         return newNode(value);  
4     } else {  
5         listAppend(list->next, value);  
6         return list;  
7     }  
8 }
```

The recursive call on line 5 creates a new node and returns it...

...but this new node is not attached to the list!
The node containing 4 still points to NULL.

Recursion

Exercises

Example - List
AppendMore
ExercisesRecursive
Helper
FunctionsRecursion vs.
Iteration

```
void listAppend(struct list *list, int value);
```

We can't recurse with this function because our recursive function needs to take in a struct node pointer.

Solution: Use a recursive helper function!

Definition

Example -
PyramidExample -
FactorialHow
Recursion
WorksRecursion on
Linked ListsExample - List
SumHow to Use
Recursion

Exercises

Example - List
AppendMore
ExercisesRecursive
Helper
FunctionsRecursion vs.
Iteration

```
void listAppend(struct list *list, int value) {  
    list->head = doListAppend(list->head, value);  
}  
  
struct node *doListAppend(struct node *node, int value) {  
    if (node == NULL) {  
        return newNode(value);  
    } else {  
        node->next = doListAppend(node->next, value);  
        return node;  
    }  
}
```

Our convention for naming recursive helper functions is to prepend “do” to the name of the original function.
